# Binary Search Tree

The keys in a binary search tree are always stored in such a way as to satisfy the **binary-search-tree property**:

Let  $x$  be a node in a binary search tree. If  $y$  is a node in the left subtree of  $x$ , then  $y.key \leq x.key$ . If  $y$  is a node in the right subtree of  $x$ , then  $y.key \geq x.key$ .

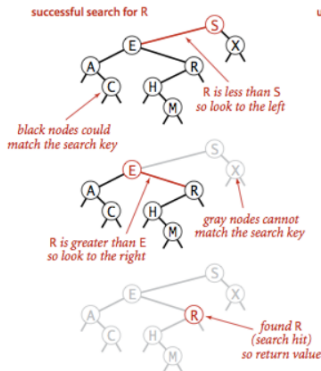

Anatomy of a binary tree

Anatomy of a binary search tree

# Search in a Binary Search Tree

- Start at the root.
- If the key equals the root, search is complete.
- If the key is smaller, go to the left subtree.
- If the key is larger, go to the right subtree.
- Repeat until key is found or subtree is empty.

# Worst Case in BST

- In the worst case, the BST becomes skewed (like a linked list).
- This happens if keys are inserted in sorted order without balancing.
- Time complexity of search/insert/delete becomes  $O(n)$ .

**Analysis.** The running times of algorithms on binary search trees depend on the shapes of the trees, which, in turn, depends on the order in which keys are inserted.

## INORDER-TREE-WALK( $x$ )

```
1  if  $x \neq \text{NIL}$ 
2      INORDER-TREE-WALK( $x.\text{left}$ )
3      print  $x.\text{key}$ 
4      INORDER-TREE-WALK( $x.\text{right}$ )
```

# Searching in BST

**TREE-SEARCH**( $x, k$ )

```
1  if  $x == \text{NIL}$  or  $k == x.\text{key}$   
2      return  $x$   
3  if  $k < x.\text{key}$   
4      return TREE-SEARCH( $x.\text{left}, k$ )  
5  else return TREE-SEARCH( $x.\text{right}, k$ )
```

# BST: Minimum and Maximum

**TREE-MINIMUM( $x$ )**

```
1  while  $x.left \neq \text{NIL}$   
2       $x = x.left$   
3  return  $x$ 
```

**TREE-MAXIMUM( $x$ )**

```
1  while  $x.right \neq \text{NIL}$   
2       $x = x.right$   
3  return  $x$ 
```

# BST: Imbalanced ( $10 \rightarrow 20 \rightarrow 30$ )

# Balanced Trees: definition & examples

**Definition.** A (search) tree is *balanced* if its height  $h$  grows logarithmically with the number of nodes  $n$  so search/insert/delete are  $O(\log n)$ .

## Examples

- **AVL:**  $|\text{bf}(v)| \leq 1$ ; rotations restore balance (height  $O(\log n)$ ).
- **Red-Black:** coloring rules, equal black-height;  $h \leq 2 \log_2(n + 1)$ .

## BST: Balanced (20 as root)

## BST: Imbalanced ( $30 \rightarrow 20 \rightarrow 10$ )

## BST: Balanced (20 as root)

## BST: Zig-Zag (4, 8, 6)

## BST: Imbalanced (4, 6, 8)

## BST: Balanced (6 as root)
